Abstract

In this project, I will use benford's law to analysis the distribution of Airbnb listings' price in Seattle and perform an exploratory data analysis figure out other features that are relevant to the rental price of Airbnb.

Price Distribution & Benford's Law

Figure 1 below shows the price distribution of Airbnb listings in Seattle. The plot displays a normal distribution but a little right skewness. It shows a high concentration of listing prices between 0 and 200 USD.

Figure 1. Airbnb Price Distribution in Seattle (\$0 ~\$1000)

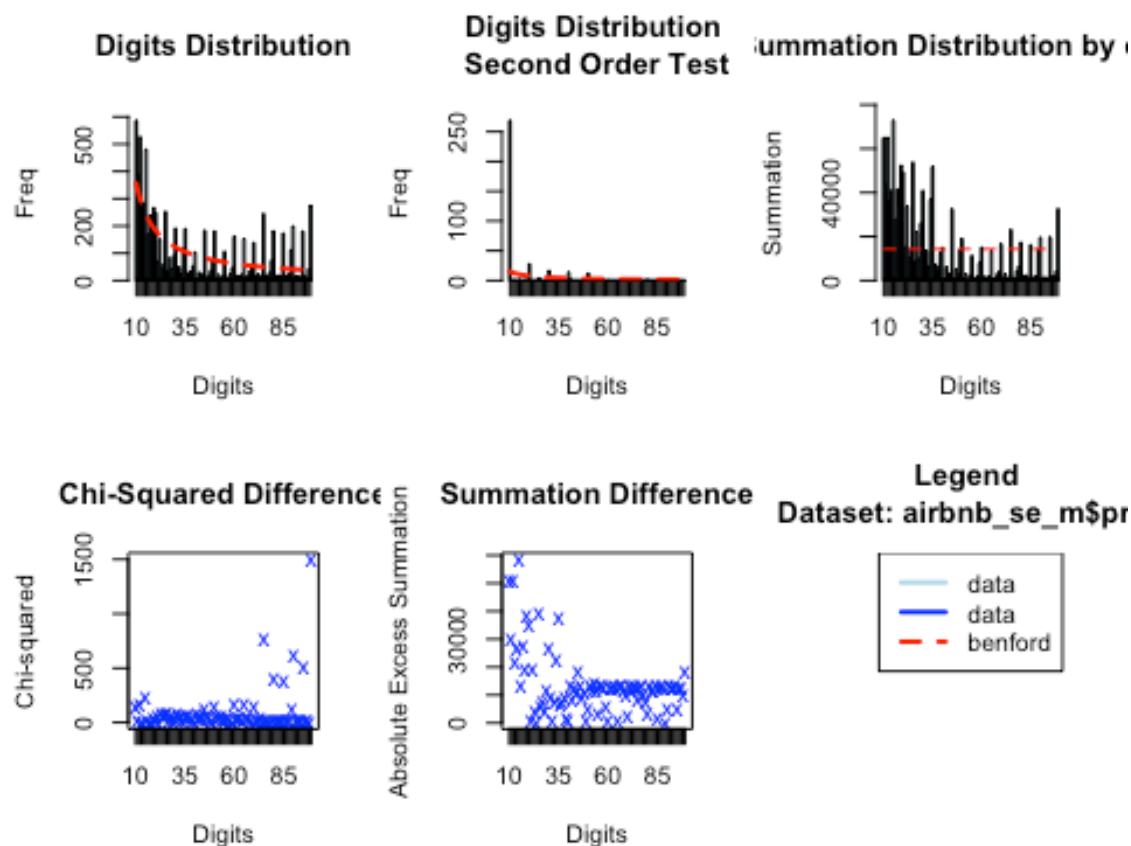

To validate the data against Benford's law, I using the first two digits to analysis 'benford'. The main results and plots of the analysis are shown below:

In the plots, the original data is in blue, and the expected Benford's distribution is in red. We can see from the first plot that the Airbnb rental price in Seattle do have a tendency to follow the Benford's Law. However, there are also some clear discrepancies.

The print result of the analysis displays the main statistics of the data. We can see that the mean value is close to 0.5. It shows the five largest discrepancies and some results of statistical tests like Chi-squared test as well. The p-value is pretty small, but we cannot focus on p-value only.

```
bf <- benford(airbnb_se_m$price)
plot(bf)
```

```
bf
##
## Benford object:
##
## Data: airbnb_se_m$price
## Number of observations used = 8610
## Number of obs. for second order = 364
## First digits analysed = 2
##
## Mantissa:
```

```
##
##      Statistic Value
##      Mean    0.48
##      Var     0.11
##      Ex.Kurtosis -1.43
##      Skewness  0.15
##
##
## The 5 largest deviations:
##
##      digits absolute.diff
## 1      15      239.67
## 2      99      237.42
## 3      10      230.61
## 4      12      227.70
## 5      75      195.47
##
## Stats:
##

Figure 2. Airbnb Price Distribution in Seattle (\$0 ~\$1000)

Other Features

There are many features that are relevant to the Airbnb rental price such as neighbourhood, number of bedrooms and number of accommodates.

Neighbourhood

Speaking of housing, most of the rental prices depend on the geographic feature. Houses in downtown are more expensive than those in suburb area. Further, the distance to shopping center or traffic station is also innegligible if we try to list a fair rental price.

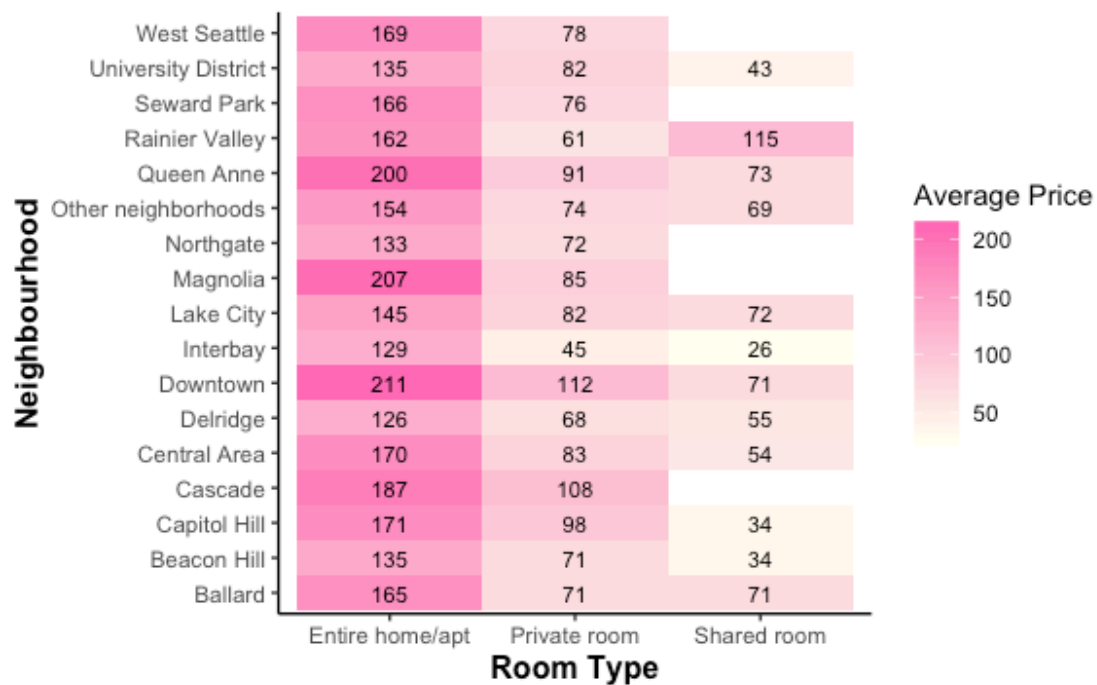

Leaflet mapping below shows the prices and names of different rental rooms in different neighbourhoods.

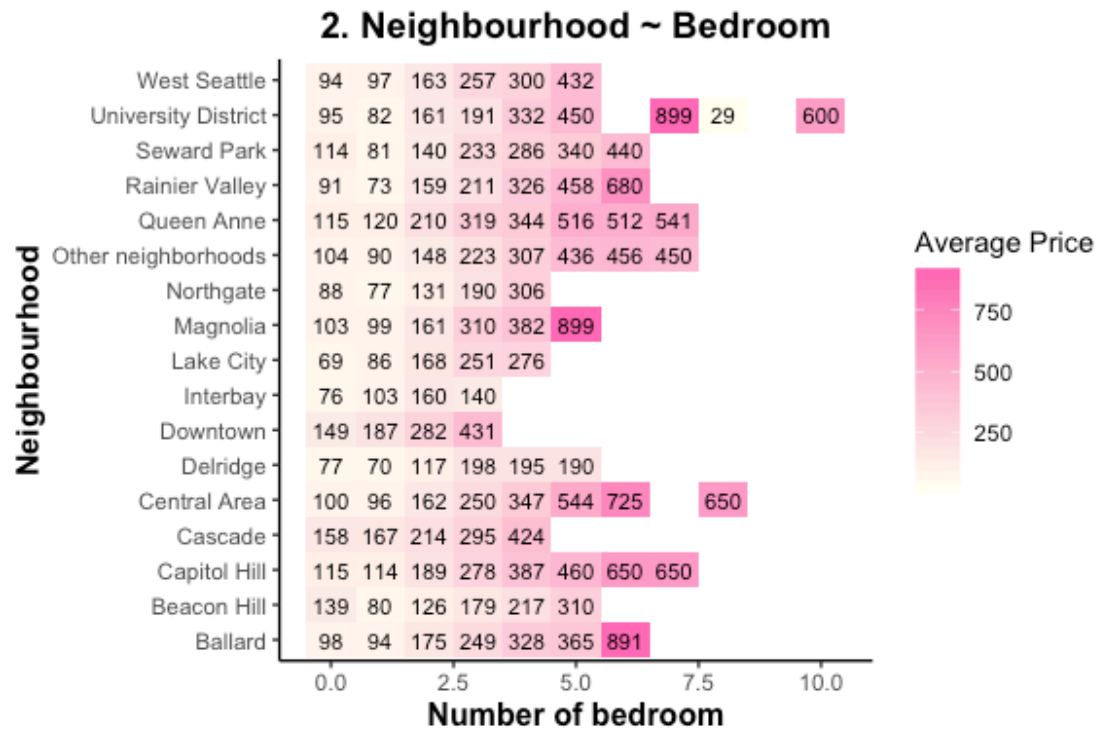

To give a better understanding of the price in different neighbourhoods, I plotted a heatmap (1) to show the average room prices in different neighbourhoods with different room types.

Next, from the heatmap(2), with the increase in the number of bedrooms, the average price of Airbnb listings in Seattle increase. Although it depends upon the neighbourhoods as well.

1. Neighbourhood ~ Room type

Number of Bedrooms

Number of bedrooms will always be a major factor to the rental price of Airbnb. I made a barplot to show the average prices over different number of bedroom. In this case, we can see from Figure 2 that there is a certain relationship between the average price of Airbnb listings and number of bedrooms.

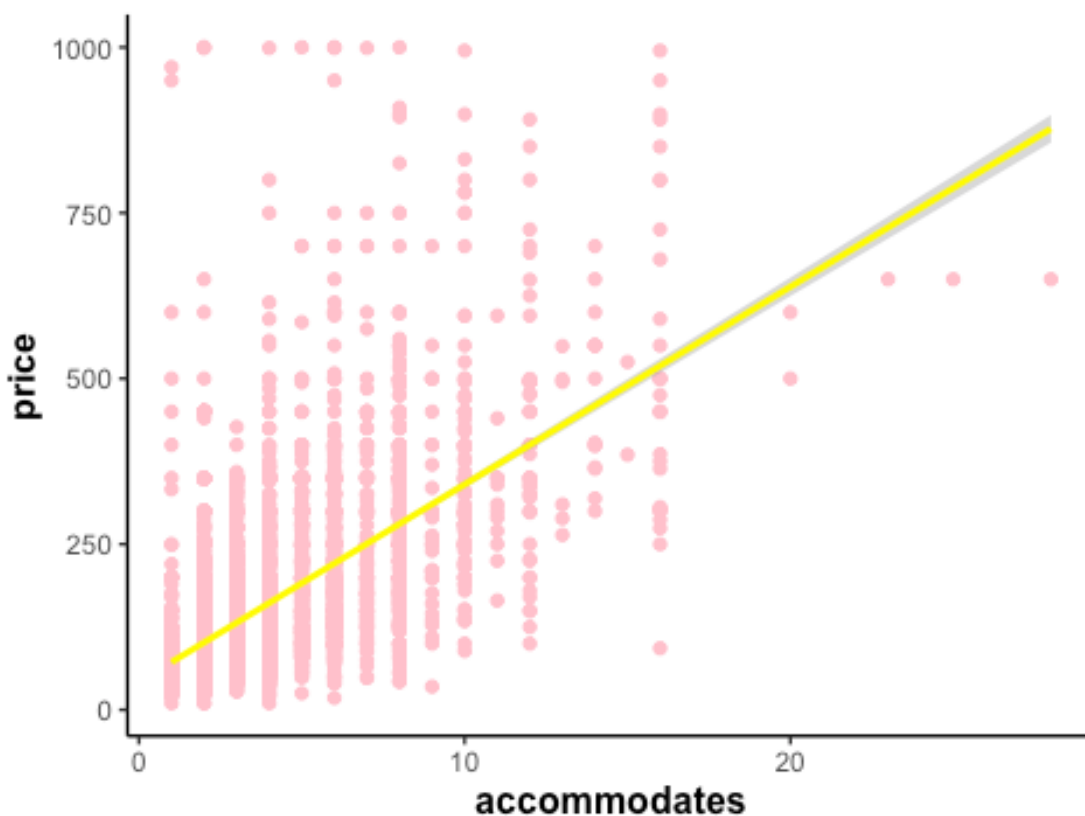

Figure 2. Price over different number of bedrooms

Number of Accommodats

We can see that number of accommodats have a certain effect on the rental price of Airbnb listings.

Figure 3. Price over Number of Accommodates

Room Type

In Airbnb listings, there are three types of room: Entire home/apt, Shared room and Private room. Room type is also a major factor of the price. Figure 4 shows the proportion of each of these three room type and we can see that there are nearly 74% of rooms are 'Entire Room/Apt'. Further, Figure 5 below shows that 'Entire room/apt' have a higher average price than 'Shared room' and 'Private room'.

Figure 4 Room Type Proportion

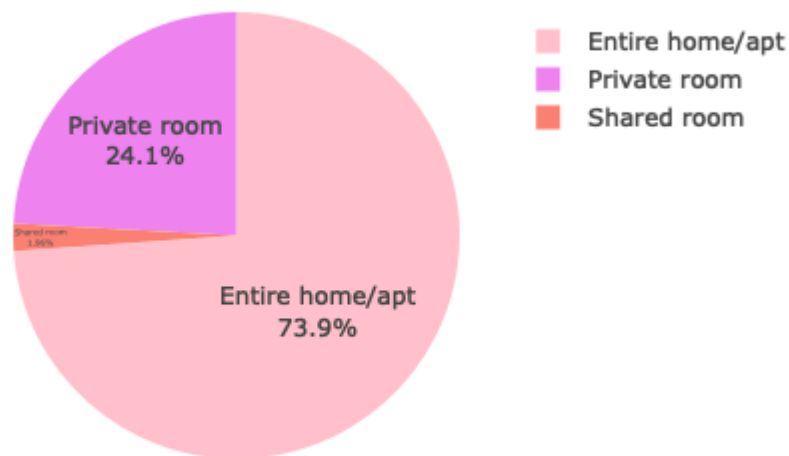

Figure 5 Price ~ Room type
